Hello,

I am interested in researching intimate partner violence in India. I have some experience with SPSS but have only utilized GSS data and not DHS data sets. When downloading the NFHS-4 dataset, there is an option for the men's recode but not women's. Is it possible to access to data that is specific to only women who completed questions in the domestic violence module? I am interested in particular socio-demographic variables specific to the 79, 729 respondents who answered questions on domestic violence and am not familiar with how to eliminate the extra cases from the individual recode dataset I initially downloaded.

Thank you in advance for your help!
