Dear Experts
Thank you for your cooperation always.
Kindly help me, i have some confusions regarding the analysis on women's empowerment. I want to analyze the relationship between women's empowerment and maternal health using the data from four developing countries.For maternal health i am using antenatal care for the most recent birth(M14_1) in five years preceding the survey by using this command in SAS (if v208=0 then delete), problem is, for women empowerment i have to combine v743a, v743b and v743d the denominator for which is currently married women v502=1, how i have to combine these two denominators v208 and v502, in SAS. Second, in NFHS 4, there are a lot of missing values in v743a, v743b and v743d. Third, how can i find the relationship by crosstab between women empowerment variable and ANC by simultaneously using both v208 and v502?
Regards.
