Hello,

I have a follow-up on this. For variable v731 only a small proportion of women answered the question, for the rest the data is missing (228,319 answered, 1,087,298 have missing data). For women who have missing data for v731, they are also missing data for other variables in that survey section. This makes me think this was intentional, but I can't find an explanation on the questionnaire or any supporting documents. Were these questions only asked to a subset of women? Does anyone know why there is so much missing data for this variable?

Many Thanks
