Hi,

I am trying to generate a variable combining 3-4 variables.

Example: At first from v157 v158 v159, I created

1) frequency of reading newspaper (yes no, 1 0) = frn

2) frequency of watching tv (yes no, 1 0) = fwt

3) frequency of listening radio (yes no, 1 0) = flr.

Now combining these 3 variables, I want to make a new variable, named "media exposure" with just (yes no, 1 0).

What should be the command in stata?

I used like this in BDHS14 KR dataset,

```
gen media= int ((frn+fwt+flr)/3)
```

```
ta media
```

But, I don't think this is right. How can I solve my problem?
