Dear DHS team,

I am analyzing 2015-2016 Malawi DHS data. I am interested in finding out postnatal care utilisation by women who had given birth 2 years preceding the survey using SPSS. Which variable should I use to restrict my analysis to women who gave birth in 2 years preceding the survey? I tried to restrict to children who were aged 0 to 24 months during the time of the survey. However, what I am getting is different with the one in the report. For instance, in the report there is 6693 while I am getting 6952 after applying sample weights.

Any suggestions will be highly appreciated.

Thanks
