Hello,

I am interested in doing a multilevel analysis looking at individuals nested within interviewers. I am trying to merge the fieldworker data with the IR and MR. I want a single file that includes men and women (as individuals)and the interviewer information.

I followed steps in a previous post on appending the IR and MR. Should I follow the same steps and append the fieldworker data as well? I am stuck because the variables to sort on (v001 v002 v003) are not included in the fieldworker questionnaire. Any guidance would be appreciated.

Thank you
