---

just a quick question, I am new to these things so i would want to learn alot

1. why do we have shbpsw and shbpsm ; shbpdw and shbpdm as seperat when for each variable they capture same info i.e shbpsw and shbpsm
2. How can I link back this new hypertension variable to individual recode in order to add a variable that is not in PR recod?

Thanks

Gowo
