---

I am trying to re-create the table from the Burkina Faso 2010 DHS Report concerning the nutritional status of children. I am looking specifically at Tableau 11.12 (page 187). I am wondering which data set was used to generate this table? Was it the KR (children's recode) file or the PR (individual household member recode) file? I cannot seem to get the total number of children in the report to match with what I have generated (total number of children in report=6,994)

Can someone give me some direction on which data file and which variable was used to generate these height-for-age standard deviation cutoffs (<-2 s.d. and <-3 s.d.)?

Thanks,

Rachel
