Hi
I am using The Gambia DHS. The svy command is for weighted samples which differs from the unweighted samples. Probably you used the unweighted which cause the difference.
I have my own issues too. I have posted here for help but no reply yet. Kindly lend me a helping hand if you can. I have problems in coding the age difference between partners.As some men have more than one wife, it was difficult for me to code age difference between partners so as to be able to assess age-disparate relationship. Please help. Thanks
