Hi.

I hereby post my code here. Hoping to receive help. I tried this but it didn't work. Thank you in advance.

Age difference between partners

```
gen wifemin = min(v034b_1, v034b_2, v034b_3, v034b_4, v034b_5, v034b_6, v034b_7, v034b_8)
```

```
gen agediff = (v012 - min(v034b_1, v034b_2, v034b_3, v034b_4, v034b_5, v034b_6, v034b_7, v034b_8)) ///
```

```
recode agediff ( -75/0=0 "older wife or no difference") (1/10=1 "1-10yrs diff") (11/20=2 "11-20yrs diff") (21/30=3 "21-30yrs diff") ///
```

```
(31/43 = 4 ">=31yrs diff") , generate (agediffcat)
```

```
label variable agediffcat "Age difference b/w husband/partner and wife/partner"
```

```
drop if agediff == 75
```
