Subject: either to take women's file, kids file, PR file or to merge household file with another in NFHS-4

We are looking at birth order and its effect on nutrition status differing by gender of the child. So, we are confused as to which file we should take from NFHS-4 data. Either PR file alone will do or kids file needs to be merged with Household file. As we have take z-scores of each child in the household so that we can control stunting for birth order. Please, help us out if anyone knows it as soon as possible. Thanks in advance.
