Dear DHS Experts,

I am trying to replicate the numbers from Table 11.1 Nutritional Status of Children (Page 159), in Ethiopia 2011 report. Below is my code for getting the percentages for different age groups and the weighted and unweighted number of children:

Use ETKR61FL.DTA

```
gen stratid = v022
gen psu = v021
gen weight = v005/1000000
svyset psu [pw=weight], strata(stratid)
```

*living with mother (respondents)

```
keep if b9==0
```

*child's age in months

```
gen age=v008-b3
```

```
label var age "Age in Months"
```

*drop if not alive

```
keep if b5==1
```

*age intervals

```
recode age (0/5=1 "0-5")(6/8=2 "6-8")(9/23=3 "9-23")(24/59=4 "24-59")(else=.), gen(child_age)
```

*tab of all living children

```
tab child_age
```

```
tab child_age [iweight=weight]
```

*Stunted & Wasted

*The measures are presented with two implied decimal places.

*No decimal points are included in the data file.

*Stunted (Height/Age)

```
tab hw70, missing
```

```
gen stunted=0
```

```
replace stunted=1 if hw70<-200
```

```
replace stunted=. if hw70==.
```

```
replace stunted=. if hw70>600
```

```
tab stunted, missing
```

```
tab stunted [iweight=weight]
```

```
tab child_age stunted, row
```

```
tab child_age stunted [iweight=weight], row
```

My age intervals are slightly different from the report. But for example, the first category, children under 6 months, the numbers I got are still different from the report.

Percentage below -2SD: 9.92% (10.0% in the report); Weighted number of children: 1,042 (1,078 in the report); Unweighted: 995 (1015 in the report).

It would be really great if anybody could help me with this. Thanks in advance!
