Dear all,

I want to make sure about my project,
I am analyzing multiple birth (twin) and neonatal mortality. I am using IDKR because my population is all live births from 2007-2012. I choose my independent variable (multiple births) from B0 which code 0= single birth and 1 (1st of multiple) and 2 (2nd of multiple) as twins. I exclude code 3,4, and 5 because I only analyze for twins not triple or so on. Is it correct what I am doing?

Is it correct that 0 is single birth and 1 and so on as birth order for the twins?

Need you guidance,

Thank you
