Dear Sir/Madam,

I am working on the antenatal care indicator "Percentage whose last birth was protected against neonatal tetanus" provided in India NFHS-4, 2015-16 report (Table 8.7 and 8.11, page 217 and 223). I have got the percentage of women who received two or more TT injections using variable M1 but could not get the "Last birth was protected against neonatal tetanus".

I want to know which variable has been used for the computation of indicator "Last birth was protected against neonatal tetanus" with the variable name and condition used in NFHS-4 India report.

Regards,

Kailash
