---

Dear DHS Experts,I have no clear understanding regarding weighting and Multiple imputation.  
1)In this forum Sometimes I have seen "iweight", sometimes "pweight" etc. Is there any difference between them?  
2)Is it possible to make multiple imputation for DHS Data? If so,what assumptions should be fulfilled?  
In SPSS I have tried,but it is impossible to run multiple imputation,if the missing value for one variable <10%.  
How can we know whether the missing value is "Missing Completely At Random (MCAR),Missing At Random (MAR) or Missing None At Random (MNAR) for DHS Data?  
All my Hero,I need your response to improve my thesis!!  
Respectfully,Hassen
