Hi,

I noticed that the number of psu (v021) per strata (v022) is very often (almost always) 1; this generates problems during analyses (no standard errors). I just wanted to verify that I am using the right variables and coding (stata).

gen weight = v005/1000000
svyset v021 [pweight= weight], strata(v022)

thx in advance,
Heleen
