A response from Technical Specialist, Dr. Shireen Assaf,
Quote:
Dear user,
You would need to use the BR or KR file and code the variable to obtain the number in the
following way. BR is all births and KR are births in the last five years. I call the variable child420
which gives the number and percentage of children born before the mother was age 20.

Stata code:

```
gen agem=b3-v011
gen agemyr = int((agem) / 12)
gen childb420=0
replace childb420=1 if agemyr<20
ta childb420
```

Thank you.

Best,
