---

I have received DHS 2014 Cambodia data set from DHS program to analyze and report on early child development index in Cambodia. I need a clarification about the age in month of children variable. According to published DHS 2014 Cambodia report, the number of children aged 36-59 months included for analysis on early child development index (ECDI) was 2617. By contrast, I got responses on ECDI related variables from 3545-3551 children in the data set that I received from DHS program. I have recoded a new variable on age of children having 36-59 month age using 'age in month' variables (W1\$1 HW1\$2 HW1\$3 HW1\$4 HW1\$5 HW1\$6). This new variable gives a sample of 1665 children. I am attaching here an SPSS output file. I have read the sample weighting report in the appendix of DHS 2014 report, but do not find information on child development topic.

Would you please, mind to let me know the variable name on 'age in month of children' variable that can be used to analyze ECDI variables from Cambodia data set.

Please, feel free to ask or write (email:[tasnuva.wahed@gmail.com](mailto:tasnuva.wahed@gmail.com)) me if needs.

Looking forward to your kind reply.
