Subject: Sampling weight calculation for Under five children of Bangladesh Posted by sabbiroeh@gmail.com on Wed, 18 Jul 2018 02:32:54 GMT View Forum Message <> Reply to Message

Dear,

I, Dr. Sabbir Ahmed, am currently doing public health research under MPH in University of Malaya, Malaysia.

I am using the secondary data set (DHS 2014) of Demographic health Survey (DHS) regarding a topic

I am facing trouble to convert the sample estimate to population estimate. Specially the V005 variabe of BDKR72FL file.

It has only weightage for women . so to divide the data of V005 by 1000000 to get the women population.

But how can I calculate the total number of Under five children of Bangladesh from this data set?

Please give your valuable input.

Regards, Sabbir
