Dear Sarah,

Thank you for your very fast replay. I'm using SPSS. I am analyzing the association between household/couples characteristics and HIV discordance result in Ethiopia 2011 DHS. I have few questions:

1. How can I merge HIV data set with other data sets (couples and Household data sets). How can I make sure whether I did proper merging of these data set? I mean is there any way I can replicate and check my merging process is correct?
2. How can I select men who are in HIV sero-discordance status (I mean men who are married/in union and have different HIV serostatus from their partners)?

Thanks again,  
Tewodros
