Hi, I'm a new user

I want to perform anova for count data in stata with survey weight, primary sampling unit.
like my dependent variable is No. of antenatal visits and independent variable is Education level,
whenever I write the following code in stata,

```
svy: oneway no_of_antenatal_visits education_level
```

then it is showing error.

Can you please tell me the write way to perform anova in stata for count data, with survey weight?
