Dear Mluleki Tsawe,

First of all, I would like to thank you for sharing such a wonderful syntax with everyone. I checked with the syntax and It worked perfectly.

While using this syntax, I was increasingly interested in your research and got acquainted with one of your articles entitled "Factors influencing the use of maternal healthcare services and childhood immunization in Swaziland".

In this article, you have shown the p-values and Chi-square of the target factors (table 2) and the target factors you have chosen for your article and in the syntax here are identical.

Would you mind to share your invaluable suggestion and syntax on how to perform these using the same data presented here (in the case of Bangladesh)

Your guidelines will help us all in our future research.

Thanking you,  
Tahneia Quader  
Hankuk University of Foreign Studies
