

Dear Expert,

Thank you for your response. As suggested previously, i have used following code, but i have not been able to compute pregnancy interval in months. Can you please advise any variables/code i can use to compute pregnancy interval in months?

The code i have used is as follow:

* Using Nepal DHS 2011

use "C:\Data\DHS_Stata\NPIR60FL.DTA" , clear
gen pregs = 0

```
forvalues i = 1/80 {  
  gen cmc`i' = v017 + 80 - `i'  
  gen event`i' = substr(vcal_1, `i', 1)  
  gen type`i' = .  
  replace type`i' = 1 if substr(vcal_1,`i',1) == "B"  
  replace type`i' = 3 if substr(vcal_1,`i',1) == "T"  
  replace type`i' = 2 if substr(vcal_1,`i',7) == "TPPPPPP"  
  replace pregs = pregs+1 if (substr(vcal_1,`i',1) == "B" | substr(vcal_1,`i',1) == "T")  
}
```

* Drop cases with no pregnancies
drop if pregs == 0

* Decide what variables you want to keep first before the reshape, modify this list as you need to add extra variables.

keep caseid v001 v002 v003 v005 v008 v011 v013 v017 v018 v019 v021 v022 v023 cmc* event* type*

* The reshape is really really really slow if you don't select variables and cases first, and will most likely fail otherwise.

reshape long cmc event type, i(caseid) j(ix)

lab def type 1 "Birth" 2 "Stillbirth" 3 "Miscarriage/abortion"

lab val type type

lab var type "Type of pregnancy"

lab var cmc "Century month code of event"

lab var event "Calendar event code"

* Set length of calendar to use

gen callen = v018 + 59

* If calendar is aligned right (as in original dataset), use the following:

gen beg = v018

gen end = callen

```

* If calendar is aligned left (as it is in some datasets), use the following:
*gen beg = 1
*gen end = 60

* Include only the five year period
keep if ix >= beg & ix <= end

* check the pregnancy types
tab type [iw=v005/1000000]

* Note that this will not match the 5444 pregnancies of 7+ months as that includes twins.
* This file excludes twins, but i believe that is what you really need.

* keep only births and stillbirths
keep if type == 1 | type == 2

*****add the twins*****
* sort by case identifiers and century month code of pregnancy end
sort v001 v002 v003 cmc
* save this file
save "pregnancies of 7 months or more.dta"

* Open birth history
use "C:\Data\DHS_Stata\NPBR60FL.DTA", clear
* Sort according to ID and CMC of birth
clonevar cmc = b3
sort v001 v002 v003 cmc
save "births.dta"

* Reopen the pregnancies files and merge in the twins
use "pregnancies of 7 months or more.dta",clear
merge 1:m v001 v002 v003 cmc using "births.dta", keep(master match) keepusing(b*)

tab type [iw=v005/1000000]

```

Thank you so much
