Dear DHS forum,

i am using Ethiopia DHS women data 2011.

I have read that health service variables such as ANC, TT vaccine, and mode of delivery are only for most recent live birth five years preceding the survey. However, when i crosstab, stillbirth with these variables, i can see limited cases of stillbirth that have information on health service variables such as ANC, TT vaccine, and mode of delivery. Can anyone from expert group explain if the dhs collect health service information for stillbirth or why i am getting some stillbirth cases that has health service information.

Thank you

Sammy
