Dear DHS Program,

I am Ms.Khaing from Myanmar. I used the woman individual dataset in order to study the institutional delivery. The unit of analysis in my study is women who delivered the last child prior to the survey. I received 2906 sample after cleaning missing value. When I did weight for the sample. The sample size is reduced to 2740. Please let me know how can I solve this problem. In my understanding, after we had done weighted, the sample will increase or same. Thank you so much.

Best Regards,
Khaing
