---

Dear DHS Forum members,

Can I please request for help on how I can use the weight for height values in DHS 2003 for Nigeria. I need to use this variable as a proxy for children nutrition

by assigning binary values of 1 for children below -2 standard deviation and 0 for children from -2 standard deviation and above to allow me generate a multidimensional poverty index. I am confused on how the variable is derived please especially the unit used.

Best wishes,

Bitrus
