Subject: Calculation of adjusted odds ratio Posted by Sajhama on Fri, 05 Oct 2018 07:10:05 GMT View Forum Message <> Reply to Message

Hi,

Hi,

Please I have a small query regarding calculation of adjusting odds ratio for stunting. I am working on publication of paper with DHS data and I am confused regarding unadjusted and adjusted odds ratio. If all the confounding variables are in the model, then as per my understanding, this is adjusted odds ratio. If the model just contains one independent variable, then it is unadjusted.
