Dear Sir,

I have already applied survweight, tried both pweight and iweight. The number which I told earlier is coming after applying the weight. Secondly, If the number in the second column is denominator, then our estimated denominator is definitely coming larger than the given denominator. As I told before, in our estimation, the total number of children below 24 months is coming around 101955. However, the given number in the report is only around 97989.

Please let me know if I am making any mistakes.

Looking forward to hearing from you

Thanks
