
Subject: missing observations

Hi,

I am working on the determinants of infant mortality in Pakistan. I am using the latest data of 2017-18 for my analysis. For some variables like child's weight at birth (m18), place of delivery (m15), and immunization variables the observations are limited in 10,000-12,000 range, despite the total observations are 50,000+.

Can I use these variables in my analysis without any problem? Can this issue be solved anyway?

Seeking early response.

Thanks.
