Subject: anemia among lactating mothers
Posted by meseret on Wed, 27 Mar 2019 06:24:40 GMT

hello,
I am using the 2016 Ethiopian DHS to see the spatial distribution and factors associated with anemia among lactating mother. However I am having difficulties matching the total number of lactating with the report table using SPSS version 25 which is 4554 on final DHS reported,but 4252 in individual women data set ,so how can I equalize number?
my second question is steps of DHS data manipulation using stata,I mean which comes first merge,sample weight,recode,drop case/observation
third,which types of sample weight can I use simple or complex?
fouth how can I prepare excel from GPS data which contain anemia prevalence,latitude and longitude?
fivth how can I know and exclude cluster which had no GPS data?

Thank you,
