Hello,

I have a few questions on the code given above for identifying the iodized salt intake

- 1, which data set do I have to use(I tried the children one but the variable HV234A doesn't exist in the children dataset?
2. if it is the household member dataset then the variable B5(child is alive) is not there.
3. with the code I can only find children that has taken iodized salt intake so how can I get the total number who were included in the interview

Thanks
