Hi

I am trying to do some analysis using more than one dataset.

I have appendend but I don't know how to use the weights with more than one dataset.

Can you help me, please?

I need to do:

1. Propottion of HH with universal covarage (I need to understand which variables to use) / year (survey) / province

2. % of people who sought care in Community health workers / year (survey) / province

3. % of under 5 that slept under ITN / year (survey) / province

4. % of population that slept under ITN by gender / year (survey) / province

5. % of HH with IRS / year (survey) / province
