Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

Your do file is correct except that you must add one more condition: sh148=hvidx. That is, after you open the data file, run this:

```
ta sh11a
keep if sh11a==1
keep if hv102==1
keep if sh148==hvidx
gen wt=hv005/1000000
```

```
ta sh150 [iw=wt]
ta sh151 [iw=wt]
ta sh152 [iw=wt]
ta sh153 [iw=wt]
ta sh154 [iw=wt]
ta sh155 [iw=wt]
ta sh156 [iw=wt]
ta sh157 [iw=wt]
ta sh158 [iw=wt]
ta sh159 [iw=wt]
ta sh160 [iw=wt]
```

```
gen discipline = 0
replace discipline=1 if
sh150==1|sh151==1|sh152==1|sh153==1|sh154==1|sh155==1|sh156==1|sh157==1|sh158==1|sh
159==1|sh160==1
ta discipline [iw=wt]
```

Apparently sh11a identifies a household in which the module will be administered, but the module is only applied to ONE child in a selected household. That child is selected at random from all children age 2-14 in each selected household. The line number of that child is given by sh148. For some reason the information is copied onto all of the other children age 2014 in the selected household, but the tables in chapter 17 must be limited to the one selected child.
