Subject: Stata weights vs CSPro weights Posted by coach1327 on Mon, 08 Jul 2019 06:06:51 GMT View Forum Message <> Reply to Message

Hi, I am currently doing a study on domestic violence using the Philippines 2017 DHS datasets. When I do frequency for CSPro using the following: V044 Universe = v502 in 1:2 weight = d005/1000000

The DHS Program User Forum

I get the published value of 11,558.

But doing the same variable in Stata using [aw=d005] I get a value of 13,215, which is also the UNWEIGHTED value in CSPro.

What am I missing in Stata?

Thank you guys in advance!
