
Subject: Calculating CI for median survival time

Dear DHS team,

I'm using DHS data and working on estimating the weighted median survival time. I have managed to get the weighted median survival time. However, I have been unable to get the standard error or confidence intervals for this estimate.

How can I calculate or obtain the confidence intervals for weighted median survival time using DHS data.

Do you have any resources on how to calculate this? Or any advice on how to do this?
