Hi,

I'm researching double burden of malnutrition (child stunting and maternal obesity at the same time in the same household.) in Pakistan using PDHS 2017-18.

The question is that how to make a pair of stunting child and overweight mother in the same household. I figured out that I have to use v001 v002 v003 to identify the household number, but I still don't know how to merge children and mother in the same household.

Also, if one mother gives birth to several children, how should I handle it for the research?

As mentioned above, I'm using STATA 14 SE.

Thank you in advance.
