Following is a response from DHS Research & Data Analysis Director, Tom Pullum:

In the appended file, I suggest that you include a variable "survey" that is numbered 1, 2, 3, 4 for the successive NFHS's. You then construct the combined PSU number with one of the "egen" commands, specifically "group". That is, if the PSU is given by v021, the command would be "egen PSU\_all=group(survey v021)". You need to do something similar for the strata, for example as "egen strata\_all=group(survey v023)". There are other ways to develop unique id codes for the clusters and strata but this is the easiest way.
