Subject: Identifying observations in same urban area without GPS

I am working on creating a rudimentary measure of "urbanization" for urban areas (using the partner's occupation since that is available across all phases). I could simply do this by PSU, but I would prefer to do it at the city level to get a less noisy measure. Is there a way to identify households that live in the same urban area that I can apply across many countries and phases? I would rather not do 286 surveys by hand ;-).
