I have found the thread posted by one of our experts, Mr. Trevor Croft. It has helped me a lot.
Thank you so much for that. However, the provided code remove other variables, which I want to
consider them in the analysis model. Would you please provide me your usual hand to separately
compute neonatal mortality, infant mortality and under-5 mortality? I, basically, want to use each
mortality variable (i.e., neonatal, Infant and under-five mortality) as an outcome of the study. Many
thanks for your help.
Regards
