Dear DHS data experts,
I am using KR file to replicate Table 11.3 page 205 in the Ethiopian DHS 2016 final report. As
exclusive breastfeeding (EBF) and Non-Exclusive BF report on the final 2016 Ethiopian DHS.
I have re-categorized:

Not still BF/ Not-breastfeeding (Non.BF),'0'. Other variables:

In this way, I have extracted and found the following results which is not consistent with the above
table 11.3.
Please, give me direction where is my failure; at variable extraction process or transforming and
computing using SPSS?

Table 11.3 on page 205 final 2016 Ethiopian DHS i found as:
EDHS 1 2 3 4 5 6
Variables Non.BF CBF BFPW BFNML BFOM BFCF Total
0 5 month 50 1042 350 70 108 107 1092

Also, the total is added to 1185 in the report which is different from 1092 I found.

I have also read Guide to DHS 7 statistics and many forums on EBF. But I didn't get about
Ethiopian DHS 2016 command to find Exclusive breastfeeding vs. Non-Exclusive BF. The
questions was also asked by other users in 2017 but no reliable information given on the forum
page at that time.

1. Are the variables identified are correct and the calculation is alright to transform using SPSS
software?
2. Would you give me clue, how to extract the variables and make suitable for analysis using
SPSS or STATA software's, Please?
I am waiting your keen response as soon as possible, please. As my outcome variable is to look
at Exclusive breastfeeding and Non-exclusive braestfeeding mothers using the selected variables
from the 2016 Ethiopian DHS.
Best regards,
