Subject: Measuring the distance between households and an Internet network Posted by Marie on Sat, 07 Mar 2020 12:21:27 GMT View Forum Message <> Reply to Message

Hello everyone,

for my research I am tying to measure the shortest distance of each household interviewed in a survey round to the Internet network within that country. I am intending to define a control and treatment group based on the households' distances to the Internet network. Those households in the proximity of 500 m to the network will be part of the treatment group whereas the rest of the households will depict the control group.

I am using QGIS but am not sure which plugin or method to use.

Any help or advice would be highly appeciated.

Thanks a lot in advance,

Marie
