Thank you very much for the link. It will be useful in my further analysis.

I have checked the codes for the do-file and used the appropriate syntax to run for the 2013-14 IR. However, i am still getting the same results as before for the two aspects that i mentioned in my initial post.

With regard to my second challenge, i have seen that variables v633b ("Refusing to have sexual intercourse with her husband if she knows he has sex with other women") and v822 ("Asking that they use a condom if she knows that her husband has an STI") were used in the link you shared to produce the first two indicators in Table 16.11 on page 306 of the Zambia DHS main report, just like what the Guide to DHS indicates. However, there is no indication of the variable which was used to produce the third indicator in the Table "Refusing to have sexual intercourse with her husband if she knows he has an STI". In the data set, i have observed that v633a is labelled "na-reason for not having sex: husband has sti" but the variable has no observation when i run it. I wonder which variable was used to produce the third indicator.

I am hoping you can help me out. Thank you.
