Subject: Multilevel analysis is Stata
Posted by Ugonna on Mon, 22 Jun 2020 23:55:41 GMT

Please I will like to find out how to get community level proportions when doing a multilevel analysis in Stata.

For instance using women's education variable, how do I find out the proportion of women in the community with different levels of educational attainment?

I learnt PSU has to be used to do that, but I'm confused as to how to go about it.

Thank you.
