Thank you very much once again.

In addition to the previous questions, I want to estimate:

- 1) stunting prevalence across urban and rural, wealth quintiles, mother's education groups
- 2) U5MR in Urban and rural, wealth quintiles, mother's education groups.

how can I proceed with stata commands to estimate in those sub-groups? I can only estimate those rates at national level.

Thanks in advance.

Regards,

Chery
