Dear,

Thanks very much. this is really helpful.

My intention is to combine such information's with their mother since my analysis is related to impact of healthcare access of the mother on children's health.

Is it correct if I first append all the PR files (2000, 2005, 2011 and 2016), after adjusting for the new WHO standard for the old survey, and then to use merge command to combined (pooled IR files again across survey with that of pooled PR files)?

Many thanks for your clarification in advance.
