One quick thing - I think you should be using the "subpop" command here instead of the "if".

<http://www.stata.com/manuals13/svysubpopulationestimation.pdf>

Subpopulation estimation involves computing point and variance estimates for part of the population.

This is not the same as restricting the estimation sample to the collection of observations within the subpopulation because variance estimation for survey data measures sample-to-sample variability, assuming that the same survey design is used to collect the data

So maybe try:

```
svy, subpop(v013) ansv v101
```

I'd be interested to know if that did the trick.
