Thanks for your question concerning the calculation of stillbirths and perinatal mortality for the India NFHS-4. It has taken quite a bit of work to prepare code to produce this for the India NFHS-4, but in the process I discovered an error in the table presented in table 7.5 by pregnancy interval. The STATcompiler contains the correct values which can be found here. I'm also attaching a PDF of the output as run in CPro.

Also attached is modified code for producing the perinatal mortality by pregnancy interval for use in Stata. This code is rearranged from the original version and updated to include the pregnancy interval. Most of the rearrangement is to speed up the execution as it can be very slow with the data file for the India NFHS-4.

Let us know if you have any problems with the code. Apologies for the delay, but this was due to the complexities of this calculation and the size of the dataset.
