Following is another response from DHS Senior Sampling Specialist, Mahmoud Elkasabi:

For Nigeria DHS 2018, you can use the numbers in Tables A.1 and A.2 to calculate the average population per EA by strata  $Ph$ , then you can estimate the average number of HHs per cluster  $Mh$  using the average HH size from the survey results  $Dh$  as  $Mh = Ph / Dh$ .  $Dh$  can be estimated from the HR data as the weighted mean of  $hv012$  by strata. The same approach can be used for Congo Democratic Republic DHS 2014.
