Following is another response from DHS Senior Sampling Specialist, Mahmoud Elkasabi:

For Nigeria DHS 2018, you can use the numbers in Tables A.1 and A.2 to calculate the average population per EA by strata Ph, then you can estimate the average number of HHs per cluster Mh using the average HH size from the survey results Dh as $Mh = Ph / Dh$. Dh can be estimated from the HR data as the weighted mean of hv012 by strata. The same approach can be used for Congo Democratic Republic DHS 2014.
