Dear All,

I just recently learn to work on my Cambodia's 2014 DHS dataset aiming at looking for IYCF indicators(MMD, MMF, MAD) predict nutritional status among children 6-23 month old.

Based on my understanding to find the dataset to fit on analysis purpose, below file I extract to cover all key variables such as Children' weight & length, child's and maternal characteristic and Household residence:

1_KHPR file (weight andleight of child)
2_KHHR file (relevant key variable in household)
3_KHKR file (information related to IYCF indicators)

I am wondering whether the above 3 datafiles will cover all information i wish to analysis.

Any comments or help are much appreciated. Thank you so much!
